Upon getting accepted to College, Jennifer was shopping around for a personal loan to help pay for school.

She decided to use her knowledge of simple interest to help her decide which loan is better.

She is going to borrow $\$ 7000$ and approaches 4 different banks.

1. Calculate the cost of borrowing.

|  | Principal | Rate of <br> Interest | Cost of Borrowing |
| :--- | :---: | :---: | :--- |
| Bank \# 1 | $\$ 7000$ | $10 \%$ | EXAMPLE <br> = Principal x Rate of Interest <br> $=\$ 7000 \times 10 \%$ <br> $=\$ 700$ |
| Bank \# 2 | $\$ 7000$ | $12 \%$ |  |
| Bank \# 3 | $\$ 7000$ | $8 \%$ |  |
| Bank \# 4 | $\$ 10000$ | $6.5 \%$ |  |

2. Calculate the amount to be repaid after 1 year.

|  | Principal | Rate of <br> Interest | Cost of Borrowing | Amount to be repaid |
| :--- | :--- | :--- | :--- | :--- |
| Bank \#1 | $\$ 7000$ | $10 \%$ | $\$ 700$ | = Cost of borrowing + <br> Principal <br> $=\$ 700+\$ 7000$ <br> $=\$ 7700$ |
| Bank \# 2 | $\$ 7000$ | $12 \%$ |  |  |
| Bank \# 3 | $\$ 7000$ | $8 \%$ |  |  |
| Bank \# 4 | $\$ 10000$ | $6.5 \%$ |  |  |
